The method is for the control of human immunodeficiency virus (HIV) infection using a composition which comprises a functional substance which participates in the infection of HIV. The method is used to control HIV-infection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             09
                                                                                                                                                                                                                                                                                                        Human collagen V-type gene – is used for diagnosis of human collagen V-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This amino acid sequence of type V collagen contains several distinct domains including a region comprising repeated (Gly-X-Y) motifs and a central domain containing two copies of the Arg-Gly-Asp cell adhesion motif. The CDNA sequence encoding type V collagen was isolated from a human placental library and will be useful for diagnosis of diseases related to type V collagen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 GIRGLKGTKGEKGEDGFPGFKGDMGIKGDRGEIGPPGPRGEDGPEGPKGRGGPNGDPGPL

Human; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

```
The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, and an allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence to pain, a method for producing a pharmaceuticial composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound the printed pain and spared nerve injury (SNI) in an animal (e.g. gene of nijury (CCI) and spared nerve injury (SNI)) in an animal e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed for the printed for the specification but was obtained in electronic form directly from wipo at the specification.
                                                                                                                                                                                                                                                                                                                                           New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 GIRGLKGTKGEKGEDGFPGFKGDMGIKGDRGEIGPPGPRGEDGPEGPKGRGGPNGDPGPL

The invention discloses a composition comprising two or more isolated rat

Claim 1; Page; 1017pp; English

```
The invention discisles a composition comprising two or more isolated factor the invention discisles a composition comprising two or more isolated factor derivative or allelic variation of the nucleic acid sequence. Also comprising the vector comprising the novel polynuclectide, a host cell comprising the vector comprising the novel polynuclectide, a host cell comprising the vector comprising the novel polynuclectide sequence which is differentially regulated in an animal subjected to pain an array, a method for identifying an agent that increases or decreases the expression of the polynuclectide sequence that is differentially expressed in neuronal tissue of a first animal composition of a polynuclectide sequence which regulates the expression of a polynuclectide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a compound that regulates the activity of one or more of the polynuclectides, a method for identifying a paperilection or man animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating cartivity in an animal of one or more of the polypeptides or their antibodies. The polynuclectide or the compound that composition comprising the one or more of pain and a pharmaceutical composition comprising the one or more of pain activity is useful for preparing a medicament for treating pain and spared nerve injury (SNI) in an animal (e.g. gene contexpersed during pain. Note: the specification, but was obtained in electronic form directly from wip of the printed to the printed the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of the printed of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GPPGEKGKLGVPGLPGYPGRQGPKGSIGFPGFPGANGEKGGRGTPGKPGPRGQRGPTGPR 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              458
                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence was used in the development of a novel method for increasing the efficiency of gene introduction into a target cell using a retroviral vector. The method comprises carrying out viral infection of the target cell in the presence of a retrovirus and target cell binding substance or substances. The method can be used to effectively introduce genes into target cells for the gene therapy of cancer and viral diseases, e.g. AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Method for increasing efficacy of gene transfer to target cell using retrovirus - by infection of the target cell in the presence of a substance which binds to the virus and a substance which binds to the target cell.

The invention relates to diagnosing endometrial cancer in a subject suspected of having endometrial cancer comprising determining the expression of a set of nucleic acid molecules or expression products in endometrial sample suspected of being cancerous, where the set of nucleic acid molecules comprises at least 2 nucleic acid molecules comprises at least 2 nucleic acid molecules comprises at least 2 nucleic acid molecules comprises an array of at least 2 of the 50 nucleic acids bound to a solid substrate. Also included is a solid-phase protein microarray comprising at least 2 antibodies or its antigen binding microarray comprising at least 2 antibodies or its antigen binding the 50 fully defined sequences as given in the specification, fixed to a solid substrate. The methods and arrays are useful for the diagnosis of endometrial cancer, selecting and monitoring treatment regimes and identification of lead compounds useful for the treatment of endometrial cancer. The present sequence is one of 50 proteins differentially expressed between cancerous and non-cancerous samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnosing endometrial cancer comprises determining expression of nucleic acid molecules or expression products that are differentially expressed in normal and malignant endometrium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           828
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          948
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 121 GERGPRGITGKPGPKGNSGGDGPAGPPGERGPNGPQGPTGFPGPKGPPGPPGKDGLPGHP 180

The present interior of any of the genes that are up-regulated or down-
comprises the sequence of any of the genes that are up-regulated or down-
comprises the sequence (e.g. about 1031 genes up-regulated in
caute lymphocytic leukemia). ACC72641 to ACC72660 represent cancer
related gene mucleotide sequences which encode the proteins given in
ABR58521 to ABR58709. Also described: (1) determining the presence or
charted gene mucleotide sequences which encode the proteins given in
ABR58521 to ABR58709. Also described: (2) an expression vector
comprising the vector; (4) an isolated polypeptide, which is encoded by
comprising the vector; (4) an isolated polypeptide, which is encoded by
comprising the vector; (5) an antibody that specifically binds the polypeptide
comprising the vector; (5) an antibody that specifically binds the polypeptide
comprising a nucleic acid is useful as diagnostic markers or
the nucleic acid is useful for
therapeutic targets. The nucleic acid is useful for
therapeutic targets. In particular, the nucleic acid is useful for
chagnosing a pathology, e.g. cancer (e.g. cancer of the bone marrow,
bladder, brain, breast, cervix, colon/rectum, kidney, lung, overy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes an isolated nucleic acid molecule, which
                                                                                                                                                                                                                 ав
                                                                                                                                                                                      New genes that are up-regulated or down-regulated in cancers, useful markers for diagnosing e.g. cancer, ischemia or heart diseases, or as therapeutic targets for screening drugs for treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 12; Page 735-736; 767pp; English.

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological cample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits conteased or decreased expression in lung cancer samples. Lung cancer compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated polypeptide, for compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell contractivity pneumonitis, intersitial pulmonary disease, fibrosis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, bronchiectasis. The genes, polymucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences

```
This fusion protein is a preferred sequence covered by the invention. It comprises amino acids 1239 to 1515 of human fibronectin linked to amino acids 261 to 427 of human collagen XI via an optional spacer. The C-terminal sequence is derived from lacz. See AAQ26040-5 and AAR22274. (Updated on 25-MAR-2003 to correct PA field.)
Polypeptide for new insulin delivery system - contg, sequence of human fibronectin cell adhesion domain and sequence of human vitronectin or collagen XI insulin binding site.
                                                                                                                                                                                                     Disclosure, Page 3 and Fig 2; 13pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 66, Application US/07609716
Patent No. 5514581
GENERAL INFORMATION:
APPLICANT: Ferrari, Franco A.
APPLICANT: Cappello, Joseph
TITLE OF INVENTION: Synthetic Protein Polymer
NUMBER OF SEQUENCES: 118
CORRESPONDENCE ADDRESS:
ADDRESSEE: Flehr, Hobbach, Test, Albritton & Herbert
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                COUNTER: US

                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 33, Application US/08642255
Patent No. 5773249
GENERAL INFORMATION:
APPLICANT: FERRARI, Franco A.
TITLE OF INVENTION: High Molecular Weight Collagen-Like
TITLE OF INVENTION: Protein Polymers
NUMBER OF SEQUENCES: 135
CARRESPONDENCE ADDRESS:
ADDRESSED: FLEHR, HOHBACH, TEST, ALBRITTON & HERBERT
STREET: 4 Embarcadero Center, Suite 3400
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Indels

C; Comment: Prolines and lysines at the third position of the tripeptide repeating unit (are 5-hydroxylated and subsequently O-glycosylated.
C; Comment: A long form of the mature protein containing part of the amino-terminal propein the third position.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ay Map position: 9434.2-9434.3
C;Complex: type V collagen may be a homotrimer of alpha 1(V) chains, a heterotrimer of the alpha 2(V) chain and one alpha 3(V) chain, initially linked by disulfide bonds among the ength, is formed with desmosine cross-links made from lysine and allysine residues C;Function:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Appearation: structural component of extracellular fibrous polymer associated with cell A; Description: structural component of extracellular fibrous polymer associated with cell A; Note: may play a role in controlling the lateral growth of collagen I fibrils c; superfamily: collagen alpha I(V) chain; fibrillar collagen carboxyl-terminal homology c; Reywords: coiled coil; extracellular matrix; glycoprotein; hydroxylysine; hydroxyprolis P; 1-37/Domain: BARP-like #status predicted cPRRP- F; 38-54/Domain: maino-terminal propeptide #status predicted cPRO- F; 542-1605/Product: collagen alpha I(V) chain, short form #status predicted cMAT> F; 559-127/Region: maino-terminal nonhelical telopeptide F; 559-127/Region: cell attachment (R-G-D) motif F; 663-665/Region: cell attachment (R-G-D) motif F; 663-665/Region: cell attachment (R-G-D) motif F; 663-665/Region: cell attachment propeptide #status predicted cCPR> F; 1606-1838/Domain: carboxyl-terminal propeptide #status predicted cCPR> F; 1615-1837/Domain: fibriliar collagen carboxyl-terminal homology cFCC>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            F;1605-1606/Cleavage site: Ala-Asp (procollagen C-endopeptidase) #status predicted

Substance alpha 1(X) chain precursor - chicken
NiAlternate names: type X collagen
C;Species: Gallue gallus (chicken)
C;Species: Gallue gallus (chicken)
C;Species: Gallue gallus (chicken)
C;Species: Gallue gallus (chicken)
C;Species: 07-Oct-1994 #sequence revision 10-Nov-1995 #text_change 13-Aug-1999
C;Accession: S23297; A31896; $65594; S77711; ISO218
R;Ninomiyay, Y; Castagnola, P; Gerecke, D.; Gordon, M.K.; Jacenko, O.; LuValle, P.; Mc maguchi, N.; Olsen, B.R.
in Extracellular Matrix Genes, Sandell L.J. and Boyd C.D., eds., pp.79-114, Academic Pr A;Title: The molecular biology of collagens with short triple-helical domains.
A;Reference number: S22243
A;Accession: S23297
A;Scatus: prelluinary
A;Molecule type: mRNA
A;Residues: 1-674 «NIN»

Complex: type V collagen may be a homotrimer of alpha 1(V) chains (see PIR:CGHUIV), a alpha 2(V) chain and one alpha 3(V) chain, initially linked by disulfide bonds among the ength, is formed with desmosine cross-links made from lysine and allysine residues
                                                                                                                                                                                                                                                                                                                              C;Function: structural component of extracellular fibrous polymer associated with cell A;Description: structural component of extracellular fibrilar collagen carboxyl-terminal homology; C;Superfamily: collagen alpha 1(I) chain; fibrillar collagen carboxyl-terminal homology; C;Reywords: colled coil; extracellular matrix; glycoprotein; hydroxylysine; hydroxyproli; P;27-1250/Promain: signal sequence #Estatus predicted <ANT>
